

CDAF Task Team Highlights 2024 – 2025

Climate Data Assessment Framework

TAG Objectives

To create a user friendly interface to create the statistics required by the GHR SST Climate Data Assessment Framework and automatically fill in the required summary page for any SST data record to allow for user comparisons between different datasets.

Outlook and Issues

Because the work is being done at a best effort basis the development of the code/interface has been slow. In particular, in the last year while we have had a number of online meetings to discuss the work (4 meetings) and next steps little actual progress was made because we were waiting on a matchup database from Jean-Francois. This was delivered at the end of March 2025 but due to project pressures on everyone at that point there has been no time to use the MMD for further development before the GHR SST meeting. Therefore, no significant progress has been made this year but know that the MMD is available we hope to make progress in the next year.
